ABSTRACT: The first collection of *Quercus aliena* Blume var. *acuteserrata* Maxim. ex Wenz. in Taiwan was made by Y. Shimada in 1924 from Hongmao. Since then, no other specimen had ever been collected. Recently, this species was rediscovered from Fengshan (3 km south of Hongmao) in Hsinchu County. On closer studies it was found to be the typical variety of *Q. aliena* Blume rather than the name recognized by Shimada. The population of *Q. aliena* is quite small at that limited location, and is vulnerable to human impacts. Therefore, it is necessary to take steps to conserve the habitat as soon as possible. The taxonomic treatment, morphological descriptions, photographs and notes of the species are given here. A key to distinguish it from the other three closely related Taiwanese species is also provided.

KEY WORDS: *Quercus aliena*, Description, Distribution, Flora of Taiwan, Rare species, Taxonomy.

INTRODUCTION

On Sept. 22, 1924, Yaichi Shimada, a Japanese forester, collected a specimen of Fagaceae from Hongmao, Hsinchu. The specimen was identified as "*Quercus aliena* Bl. var. *acute-dentata* Maximowicz" on the label. Although it was a new record to Taiwan, Shimada never reported his discovery in any paper.

Six years later, another Japanese forester, Syuniti Sasaki, adopted the name "*Quercus aliena* Blume var. *acuteserrata* Maximowicz" when he published a catalogue of the specimens presented in the Herbarium of the Department of Forestry, Government Research Institute, Formosa (Sasaki, 1930). Since then, the name has been used by all botanists (Kanehira, 1936; Liu, 1962; Liu, 1968; Liu & Liao, 1976; Shen, 1984; Liao, 1991, 1996; Yang et al., 1997) for over 70 years. Despite numerous explorations in the Hsinchu area, additional specimens had never been found. For this reason, Kanehira (1936) thought that it might be introduced, and Shen (1984) thought it had been extinct from Taiwan.

In the course of floristic inventory in Hsinchu on Oct. 14, 2002, the fourth and fifth authors found a wild population considered to be the same species as that collected by Shimada. This plant was finally identified as *Quercus aliena* Blume according to the original descriptions by Blume (1850) and Wenzig (1886), and the key and description in Huang et al. (1998). This identification was further confirmed by comparing with Chinese and Japanese specimens deposited at the Herbarium of the Department of Botany, National Taiwan University (TAI) and the Herbarium of the Taiwan Forestry Research Institute (TAIF).

In the present paper, nomenclature, descriptions, and notes are given. In addition, a key is provided to distinguish it from the other three closely related Taiwanese species. The materials collected by the authors are preserved in the TAI Herbarium of National Taiwan University.

TAXONOMIC TREATMENT

Deciduous trees to 10 m high, trunks 0.3 m across; bark rigid, irregularly furrowed, gray; branchlets grayish brown, glabrescent, lenticellate; buds ellipsoid, scales brown, ciliate. Leaves coriaceous, elliptic-ovate to obovate, 10-25 cm long, 5-14 cm wide, the apex obtuse to acuminate, the base cuneate to rounded, dentate, deeply green, glabrous above, grayish-white, densely stellate-hairy beneath, lateral veins 9-15-paired; petioles 0.5-2 cm long, glabrous. Inflorescences catkins or spikes, coetaneous in spring, borne on leafy flowering branchlets. Staminate catkins pendulous, 4-8 cm long; staminate perianth 6-lobed, the lobes linear; stamens 7-10. Pistillate flowers axillary, cupules solitary or in fascicles of 2 or 3, 2-3 mm long, 2-2.8 mm broad; imperfect ovary 2-4-celled, styles 2-4, bracts ovate-lanceolate, 2 mm long, crowded, grayish pubescent. Cupules cupulate, 0.5 cm high, 1.5 cm broad, enclosing ca. 1/3 of nut, covered with small triangular imbricate scales. Nuts ellipsoid to ovoid, about 1.5-2 cm long, 1-1.5 cm broad, hairy becoming glabrate, scar slightly raised, maturing from Sept. to Nov.
Distribution: China, Japan and Korea. Taiwan, found only at Fengshan near Niukoulin, Hsinchu County. N24° 52′ 53″, E120° 57′ 43″ (E246150, N2752650 in TWD67). Elevation is about 100 m.

Notes: The rediscovery of Q. aliena at Fengshan is not surprising since the place is near Hongmao where Shimada collected his specimen in 1924. Although specimen of this species was originally identified as Q. aliena var. acutiserrata rather than Q. aliena var. aliena, the two are easy to distinguish. The leaf margin of var. aliena is coarsely dentate-sinuate, and the apices of teeth are obtuse or rounded. This is in contrast to the margin of var. acutiserrata that is coarsely serrate with apices of serrations acuminate or acute.

In Taiwan, trees of Q. aliena form a mixed association with Q. variabilis Blume. It grows only on the windward slopes (against the winter monsoon). The trees are windswept and stunted, and are quite low (usually less than 10 m tall) as compared to those reported elsewhere in China (Liu & Liao, 1976; Huang et al., 1998) and Japan (Satake et al., 1989).

The population of Q. aliena is quite small (about 100-200 individuals) at that limited location, and is vulnerable to human impacts. Unless steps are taken to conserve the habitat soon, it will be in danger of extinction in Taiwan.

Key to Taiwanese species closely related to *Q. aliena*

1. Scales of cupule subulate, linear or narrow lanceolate, vary long and spreading.
2. Leaf blade narrowly elliptic-lanceolate to ovate-lanceolate, margins spiniform dentate; scales of cupule subulate or linear, often reflexed ..........................*Q. variabilis*
2. Leaf blade obovate to narrowly obovate, margins undulate to rough dentate; scales of cupule narrowly lanceolate, erect or reflexed ..........................*Q. dentata*
1. Scales of cupule triangular, very short and adnate.
3. Leaf margins glandular ...........................................*Q. glandulifera var. brevipetiolata*
3. Leaf margins not glandular ...........................................*Q. aliena*

ACKNOWLEDGEMENTS

We thank administrators of TAI and TAIF for allowing examination of their specimens. Gratitude is also due to Dr. Chun-Neng Wang in Edinburgh for literatures.
